

Aquarium Thermometers

Instructions for Use

Place unit on
front or side

Installation Instructions:

1. Select a location below water line and on the outside of the aquarium.
2. Remove release paper exposing adhesive backing.
3. Place thermometer on aquarium and press firmly in place.

CAUTION: Avoid placing in direct sunlight for prolonged periods.

How It Works:

The thermometer utilizes sensitive color changing liquid crystals. Each temperature indicator (number) is a separate formulation manufactured by Hallcrest under strict laboratory specifications. This highly accurate thermometer is fully calibrated. When adhered to the aquarium (see installation instructions) the unit reacts immediately to temperature changes.

Read temperature as follows:

1. Green = Exact temperature
2. Tan/Red = 1 degree lower
3. Blue/Violet = 1 degree higher

If no reading appears, the temperature of the water has exceeded the thermometer range (hot or cold). IMMEDIATELY check (feel water): Is heater malfunctioning?

Advantages:

Easy to read, Accurate, Safe - Non toxic. Unbreakable, Non-corrosive, Mounts on the outside of your aquarium. You can read the temperature at a glance. Thermometer can be repositioned.
